Deluxe Test Equipment Kit

Ransburg's deluxe paint tester package can be used to check all aspects of your system.

■ Package Features:

- Multiple ohm scale for parts testing and checking components (in G Ω).
- Ground testing of conveyORIZED products

■ Deluxe Test Equipment Kit Includes

- Paint Test Probe
- Sprayability / Paint Test Meter
- Gun Output Test Leads
- kV Test Probe Kit
- Handy, protective carrying case

Sprayability Test Meter and Test Leads

By measuring the surface resistance of materials normally considered to be electrically nonconductive and indicating the degree of sprayability on a standard scale, the Sprayability / Paint Test Meter can determine whether such materials can be electrostatically sprayed or whether they need to be treated with solutions to make them conductive.

■ Sprayability / Paint Test Meter Features:

- Measures surface conductivity or confirms if the workpiece is grounded or not.
- Compact and user-friendly.

Sprayability Test Meter and Paint Probe

Designed to provide measurement of the electrical resistance of paint formulations for all electrostatic applications as well as the short circuit current (SCI) of electrostatic applicators. It has an SCI scale (0 to 250 microamperes) and paint resistance scales (infinity to 0.01 and 2.0 to 0.001 in megohms).

■ The Paint Test Meter and Probe features:

- Digital multi-scale meter with integrated Sprayability Meter.
- Matching Paint Resistance Probe.
- Gun output test leads for short circuit current (SCI).

Sprayability Test Meter and kV Probe

The kV Test Probe provides an accurate way to check electrostatic voltage of application equipment.

■ The kV (kilovolt) Test Probe features:

- Measures all types of electrostatic equipment.
- Accurately displays throughout the entire measurement range.
- Certified to ISO standards from the factory.
